

Case study on Automatic Facial Expression Recognition

# **SVMs In Action**

Mitchel Benovoy

# Outline

- The facial expression recognition problem
- The important of **pre-processing** your data
- SVMs for feature selection
- SVMs for classification
  - Multi-class approaches with SVMs
  - The black-art of tuning the parameters

# The Facial Expression Recognition Problem

Anger

Fear

Happy

- Motivations:
  - Enhance human/robot-computer interaction
  - Design games for expressivity training (children with autism)

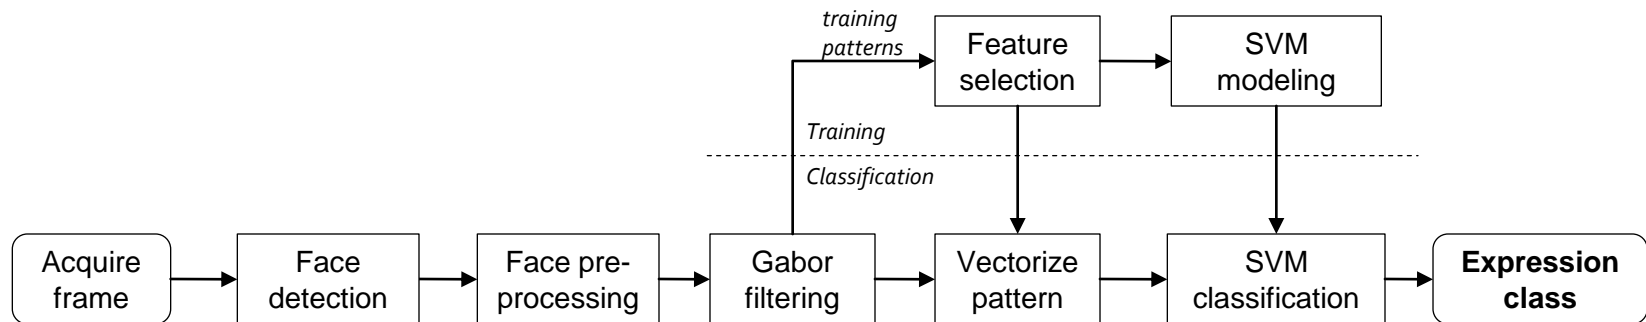

# Constraints and Expectations

- Real-time operation
- Generalizes well
  - Gender
  - Race
  - Face type
  - Facial hair
- > 90% classification accuracy

**SVMs seem like the perfect candidate**

# Process Overview

# Gabor Filtering

- Exhibits optimal joint spatial locality and frequency information

Vectorized each sample to  $1 \times d$

255	246	67	78	120	236	201	...
-----	-----	----	----	-----	-----	-----	-----

- Downside to Gabor filtering:

Sample vectors are very high dimensionality:

For a **32 x 32** face image,  **$d = 40960$** .

# Data Matrix Formulation

- Given  $c$  classes and  $n$  total samples:
- Construct a label vector  $Y$  and a matrix  $X$  containing all the data:

	$n \times 1$		$n \times d$																																										
$Y =$	<table border="1"><tr><td>1</td></tr><tr><td>1</td></tr><tr><td>2</td></tr><tr><td>2</td></tr><tr><td>3</td></tr><tr><td>3</td></tr></table>	1	1	2	2	3	3	$X =$	<table border="1"><tr><td>255</td><td>45</td><td>97</td><td>197</td><td>...</td><td>205</td></tr><tr><td>247</td><td>56</td><td>84</td><td>200</td><td>...</td><td>222</td></tr><tr><td>236</td><td>78</td><td>99</td><td>245</td><td>...</td><td>128</td></tr><tr><td>201</td><td>24</td><td>120</td><td>54</td><td>...</td><td>145</td></tr><tr><td>254</td><td>65</td><td>101</td><td>97</td><td>...</td><td>135</td></tr><tr><td>222</td><td>74</td><td>134</td><td>213</td><td>...</td><td>20</td></tr></table>	255	45	97	197	...	205	247	56	84	200	...	222	236	78	99	245	...	128	201	24	120	54	...	145	254	65	101	97	...	135	222	74	134	213	...	20

# Data Normalization for SVMs

- One of the most crucial steps when using SVMs
  - The optimization routines are sensitive to large numbers.
- Goal: map data to a standard range
- Two popular **methods** to normalize data:
  - Range normalization
  - z-Scoring
- Two popular **types** of data normalization:
  - Feature-wise
  - Sample-wise

# Range Normalization

- Maps a series of values to a specific range
- E.g., [-1:1], [0:1] ... [L:U]

V = 

255	246	67	78	120	236	201	147
-----	-----	----	----	-----	-----	-----	-----

$$V^* = \frac{V - \min(V)}{\max(V) - \min(V)} * (U - L) - 1 \quad \text{Here, } [L:U] = [-1:1]$$

V\* = 

1.0000	0.9043	-1.0000	-0.8830	-0.4362	0.7979	0.4255	-0.1489
--------	--------	---------	---------	---------	--------	--------	---------

# z-Scoring

- Standardizes a series of values to zero-mean, unit-variance:

$V =$ 

255	246	67	78	120	236	201	147
-----	-----	----	----	-----	-----	-----	-----

$$V^* = \frac{V - \text{mean}(V)}{\text{std}(V)}$$

$V^* =$ 

1.1352	1.0168	-1.3392	-1.1944	-0.6416	0.8851	0.4245	-0.2863
--------	--------	---------	---------	---------	--------	--------	---------

# Feature-Wise Normalization

- Each column is a feature (pixel value in this case)

$X =$

255	45	97	197	205
247	56	84	200	222
236	78	99	245	128
201	24	120	54	145
254	65	101	97	135
222	74	134	213	20

$X^* =$

1.00	-0.22222	-0.48	0.497382	0.831683
0.703704	0.185185	-1.00	0.528796	1.00
0.296296	1.00	-0.4	1.00	0.069307
-1.00	-1.00	0.44	-1.00	0.237624
0.962963	0.518519	-0.32	-0.54974	0.138614
-0.22222	0.851852	1.00	0.664921	-1.00

# Sample-Wise Normalization

$X =$

255	45	97	197	205
247	56	84	200	222
236	78	99	245	128
201	24	120	54	145
254	65	101	97	135
222	74	134	213	20

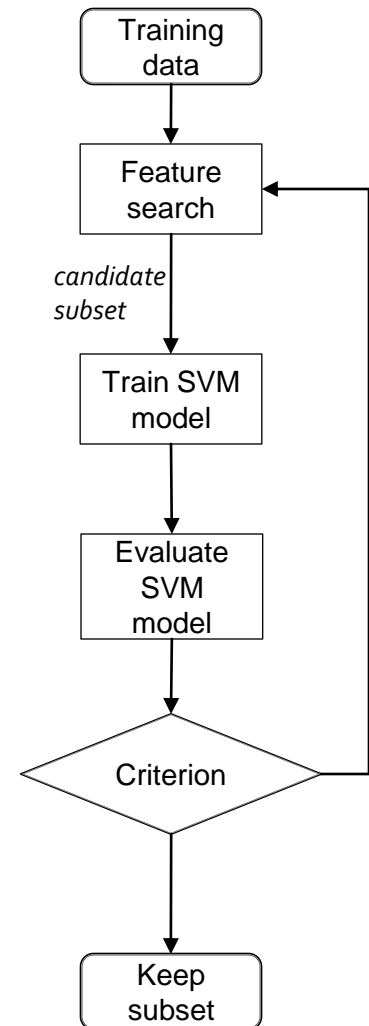

$X^* =$

1	-1	-0.50476	0.447619	0.52381
1	-1	-0.70681	0.507853	0.73822
0.892216	-1	-0.7485	1	-0.4012
1	-1	0.084746	-0.66102	0.367232
1	-1	-0.61905	-0.66138	-0.25926
1	-0.46535	0.128713	0.910891	-1

# SVM-Based Feature Selection

- Goals:
  - Reduce dimensionality
  - Find the salient features that discriminate between classes
  - Improves generalization
  - Removes redundant and irrelevant features

# Salient Facial Expression Features

Feature selection is a great way to explore data.

Always check the selected features. Sometimes the searches get *stuck* or output garbage features.

*SVM-based method*

*Correlation-based method*

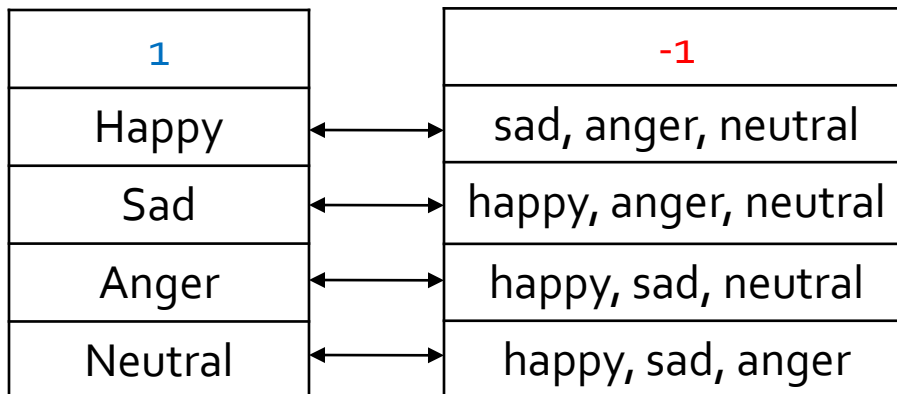

# Multi-Class SVM Modeling

- One-vs-Rest
  - Train  $c$  classifiers:

Given 4 classes: {happy, sad, anger, neutral}

Train 4 binary SVM models:

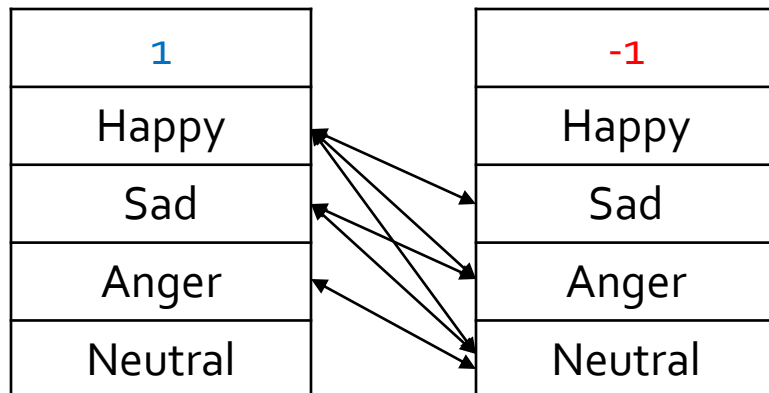

- During recognition, test each classifier and pick the positive class (1) with the largest margin (score).

# Multi-Class SVM Modeling

- One-vs-One (Pairwise modeling)
  - Train  $c(c-1) / 2$  classifiers:

Given 4 classes: {happy, sad, anger, neutral}

Train 6 binary SVM models:

- There are more classifiers, but training time decreases as there are less data for each model.
- During recognition, pick the class that is selected by the most classifiers.

# SVM Parameter Selection

- SVMs typically have 2 parameters:
  - Kernel-related variable ( $\gamma$ )
  - Cost variable ( $C$ )
- Use grid-search approach
- Manual tuning

# Performance

- 96% recognition rate on large, cross-cultural DB (Cohn-Kanade)
- 30+ fps
- Uses webcam as input
- Video...

# Thank You
